

Fisher forecast (optimistic): the Barrow deformation Δ

separation of $\Delta = 1$ from $\Delta = 0$ [σ]

$\Delta=1$ (volume-law horizon) vs $\Delta=0$ (smooth):
a discrete model-selection target
(Fisher-optimistic; marginalised errors broader)

8.7 σ
 $\sigma(\Delta)=0.115$

7.5 σ
 $\sigma(\Delta)=0.133$

11.5 σ
 $\sigma(\Delta)=0.087$
